Organisational Intelligence Dashboard Architecture

Unlike traditional competency assessments that map individual capabilities, the LSC dashboard reveals the structural health of your organisation's capability architecture. Our core visual instruments operate at system level, exposing constraint zones, alignment degradation, decision latency, and transformation risk across the enterprise.

In the Premium Tier 1 version, these diagnostics are integrated into a **Full Organisational Intelligence Dossier** — a board-ready analysis that translates structural insight into quantified performance exposure and economic value pools. The report goes beyond observation to produce a Targeted Capability Investment Map, clearly identifying what to fund, what not to fund, and where structural reinforcement is required before behavioural intervention.

Premium Tier 1 also generates an **Evidence-Based Draft RFP**, transforming diagnostic findings into a defensible capability investment brief suitable for internal budget approval or external vendor engagement. Finally, through structured **Intervention Gating**, the report determines whether Tier 2 behavioural transformation is viable, whether Tier 3 systemic redesign is required, or whether stabilisation must precede investment.

Together, these elements elevate the dashboard from a diagnostic snapshot to a strategic control instrument — enabling Board-level conversations about systemic performance, capital allocation precision, and transformation ROI, rather than individual development needs.

The Organisational Capability Radar

LSC equivalent of the spider web

SECTION 1

Organisational Capability Radar

System capability architecture across the full CTA stack — Ability, Competence, Org. Capability, Org. Intelligence, and Cybernetic Capacity.

HOW TO READ THIS CHART

A **symmetrical shape** indicates a coherent system. **Collapse in inner layers** (Ability, Competence) signals structural constraints. **Outer layer weakness** (Intelligence, Cybernetic) indicates scaling limitations. A "dented" radar reveals misaligned capability architecture.

KEY IMPLICATIONS

- Outer layer weakness — scaling limitations present despite strong foundational capabilities.

Whilst traditional assessments map individual competency gaps, the LSC Capability Radar exposes **system-level capability architecture**. This instrument measures not whether people have skills, but whether your organisation can consistently convert capability into strategic outcomes. It reveals the structural coherence of your capability stack — from individual ability through to cybernetic adaptation — making visible the architectural constraints that limit organisational performance regardless of talent quality.

Capability Radar Structure

A 5-axis radar chart measuring system layers rather than individual competencies. Each axis represents a distinct tier in the capability transformation architecture, scored 0–5 based on systemic health indicators.

Ability

Skills Base

Individual knowledge and technical proficiency across the workforce

Competence

Application Quality

Consistent skill application in real organisational contexts

Organisational Capability

Execution Consistency

Reliable delivery of outcomes across functions and contexts

Organisational Intelligence

Decision System Quality

Strategic sensing, learning velocity, feedback loop effectiveness

Cybernetic Capacity

Feedback & Adaptation

Systemic ability to sense, respond, and evolve under pressure

Visual Interpretation Patterns

The shape of your organisational radar reveals specific architectural constraints. Pattern recognition enables immediate diagnosis of systemic limitations.

Symmetrical Pattern

Indicates a **coherent system** where capability architecture is balanced. All layers develop proportionally, enabling smooth capability transformation from individual skill to organisational outcome.

Inner Layer Collapse

Reveals **structural constraint** at foundational levels. Strong outer capabilities cannot compensate for weak ability or competence base — the system is built on unstable foundations.

Outer Layer Weakness

Signals **scaling limitation**. Individual abilities exist but organisational intelligence and cybernetic capacity are underdeveloped, preventing capability from scaling beyond local execution.

Dented Radar

Demonstrates **misaligned capability architecture**. Specific capability layers are out of proportion, creating friction, waste, and strategic execution gaps across the organisation.

Why This Assessment Is Powerfull

Traditional Approach

Traditional assessments show individual capability gaps:

- Leadership competency scores
- Skill inventory analysis
- Individual perception data
- Development need identification

These tools answer: *"What skills do our people lack?"*

LSC Organisational Radar

System capability architecture reveals **structural imbalances**

- Capability transformation coherence
- Architectural constraint zones
- Systemic performance limitations
- Strategic execution capacity

This instrument answers: *"Why can't our organisation convert capability into strategic outcomes?"*

This represents a fundamentally different category of organisational assessment – moving from individual development to system architecture diagnosis.

Direction–Alignment–Commitment Heat Quadrant

Purpose

Surface structural constraint zones immediately through visual positioning.

This quadrant transforms your existing Direction–Alignment Commitment philosophy into a **quantified positioning tool**. By mapping capability strength against organisational intelligence quality, it reveals which strategic interventions are viable and where structural constraints will undermine transformation efforts. The heat quadrant makes Tier gating decisions visually obvious, enabling executives to diagnose organisational readiness at a glance.

Heat Quadrant Architecture

A 2x2 matrix positioning organisations based on capability execution strength and decision system quality. Quadrant placement determines intervention viability and transformation approach.

This quantified framework mirrors your existing DAC philosophy but enables precise diagnostic positioning. Current organisational position determines which LSC Tier interventions will generate ROI and which will encounter structural resistance.

Strategic Implications by Quadrant

Adaptive High Performer

High Intelligence / High Capability

Tier 3 viable. Organisation can absorb strategic transformation. Focus: scaling innovation and market leadership.

Insightful but Ineffective

High Intelligence / Low Capability

Tier 2 intervention required. Strong strategic sensing undermined by execution weakness. Focus: capability building before scaling.

Efficient but Rigid

Low Intelligence / High Capability

Tier 1 diagnostic essential. Execution strong but decision systems limit adaptation. Focus: developing feedback loops and learning velocity.

Disordered & Underperforming

Low Intelligence / Low Capability

Tier 1 mapping critical. Structural constraints across both dimensions. Focus: establishing control layer visibility before any transformation investment.

Quadrant positioning makes Tier gating visually obvious, preventing mismatched interventions that waste transformation investment.

Example: Direction Alignment Commitment Quadrant

SECTION 2

Direction–Alignment–Commitment

Structural constraint zone mapping — positioning capability strength against organisational intelligence.

HOW TO READ THIS CHART

This quadrant maps **Capability Strength** (x-axis) against **Organisational Intelligence** (y-axis). The black marker shows current position. Movement toward the **top-right** indicates readiness for advanced engagement tiers.

KEY IMPLICATIONS

- Efficient but rigid — Tier 2 engagement recommended to build intelligence layers.

Why the Heat Quadrant Matters

Diagnostic Power

- Makes **Tier gating visually obvious** through spatial positioning
- Positions **Tier 1 as control-layer mapping** for low intelligence organisations
- Signals whether **Tier 2 or Tier 3 interventions are viable** based on structural readiness
- Prevents transformation investment in organisations architecturally unprepared to absorb it

Executive Communication

The heat quadrant enables **Board-level conversations** about organisational readiness without HR jargon.

Executives immediately understand:

- Current structural positioning
- Constraint zone implications
- Intervention sequencing logic
- ROI risk exposure by quadrant

This transforms capability assessment from HR reporting to strategic risk management.

Alignment Degradation Curve

Purpose

Visualise strategic dilution across organisational layers, revealing where direction erodes into misalignment.

Strategic intent rarely survives intact as it cascades through organisational layers. The Alignment Degradation Curve **quantifies interpretation variance** from Executive Committee through to operational delivery. Rising curves signal systemic misalignment; flat lines indicate coherent strategic translation. When overlaid with decision latency data, this instrument reveals whether your organisation can maintain strategic coherence under execution pressure — a core predictor of transformation ROI erosion.

Example: Alignment Degradation Curve

The blue line shows strategic alignment dropping across layers — a falling curve signals strategic dilution. The orange dashed line shows decision latency rising when both lines intersect — transformation ROI becomes unpredictable.

SECTION 3

Alignment Degradation Curve

Strategic interpretation variance and decision latency across organisational layers.

HOW TO READ THIS CHART

The **blue line** shows strategic alignment dropping across layers — a rising curve signals strategic dilution. The **orange dashed line** shows decision latency — when both rise together, transformation ROI erosion is probable.

KEY IMPLICATIONS

- Variance slope exceeds threshold — structural misalignment is likely across organisational layers.
- Both alignment degradation and decision latency are elevated — transformation ROI erosion is probable.
- Strategic interpretation variance exceeds 40 points from ExCo to Operational — strategic dilution is severe.

Diagnostic Thresholds

If variance slope > 0.15 per layer:

Structural misalignment likely. Strategic intent eroding significantly between layers.

If slope + latency both elevated:

Transformation ROI erosion probable. Organisation cannot maintain strategic coherence under execution pressure.

These thresholds enable immediate diagnosis of systemic alignment health, strengthening interpretive guidance format

Value Pool Exposure Map

Purpose

Connect capability gaps directly to ROI risk and financial exposure.

This is what traditional assessments do not provide: **direct linkage between capability architecture and financial value at risk**. The Value Pool Exposure Map translates abstract capability gaps into quantified ROI risk across strategic value pools. By overlaying estimated financial ranges from Premium modelling, this instrument transforms capability assessment from HR reporting into CFO-relevant risk intelligence. Executives can immediately see which capability constraints threaten specific sources of strategic value.

Value Pool Exposure Architecture

A horizontal bar chart connecting capability gaps to financial risk across strategic value pools. Exposure levels indicate ROI vulnerability, with optional Premium modelling providing estimated financial ranges.

Premium Tier modelling overlays estimated financial ranges for each exposure level, enabling Board-level conversations about capability risk in monetary terms rather than HR abstractions.

ADVANCED OPTION

Decision Latency Architecture Map

An optional advanced visual for Premium Tier clients seeking network-level visibility into decision system bottlenecks. This network diagram elevates LSC diagnostics above survey-style competitor approaches.

Visual Elements

- **Nodes:** Decision points across organisational architecture
- **Edge thickness:** Decision latency duration
- **Red nodes:** Structural bottlenecks constraining flow
- **Dashed loops:** Escalation redundancy and rework

Diagnostic Value

This map reveals **where decisions get stuck** in your organisational architecture. Unlike perception surveys measuring "decision-making quality", this instrument exposes the structural topology of decision flow showing which nodes create systemic delays and which escalation patterns represent architectural waste. It transforms invisible friction into visible network constraints.

This level of architectural visibility distinguishes LSC's diagnosis, positioning the platform as system intelligence rather than survey reporting.

ADVANCED OPTION

Decision Latency Architecture Map

SECTION 5

Decision Latency Architecture Map

Network topology of decision flow — exposing structural bottlenecks and escalation loops across organisational layers.

HOW TO READ THIS CHART

This network diagram reveals **structural bottlenecks** in your decision architecture. Node size and color indicate latency severity, edge thickness shows decision flow duration. Dashed lines represent escalation loops — rework patterns that add architectural waste. Unlike survey-based tools, this exposes the **topology of decision flow**.

KEY IMPLICATIONS

- Critical bottleneck at Operational level (16 days) — decision architecture requires immediate redesign.
- System-wide latency suggests architectural rigidity — consider parallel decision pathways.
- 1 escalation loop detected — structural rework patterns adding cycle time.

 Why This Is Strategically Powerful? It does two things:

1. Elevates L&D to capital allocation conversation
2. Prevents generic programme commissioning

LSC measures economic exposure caused by architectural constraint.

Engagement Integrity Dial

Leadership Balance

Fair Process

Dialogue Quality

Learning Velocity

PREMIUM EXTENSION

Advanced Decomposition Architecture

Premium Tier 1 clients gain access to **layered radar decomposition**, where each primary axis expands into constituent system elements. This enables surgical precision in constraint identification whilst maintaining executive-level dashboard simplicity.

Organisational Capability Decomposition

- **Decision coherence:** Strategic alignment quality across layers
- **Escalation efficiency:** Decision flow velocity and routing logic
- **Cross-functional coordination:** Lateral integration effectiveness
- **Governance clarity:** Authority and accountability architecture

Organisational Intelligence Decomposition

- **Feedback loops:** Sensing and response mechanism quality
- **Data utilisation:** Information-to-insight conversion efficiency
- **Strategic sensing:** Early signal detection and interpretation
- **Learning velocity:** Adaptation speed and knowledge integration

The radar becomes layered — executives see the high-level architectural health, then drill into constituent system elements for precise constraint diagnosis. This prevents information overload whilst enabling surgical intervention design.

CORE INSTRUMENT 6

Example: Capability Stress Map

SECTION 4

Capability Stress Map

Decomposed view of capability sub-dimensions with stress-level colour coding.

AI-Analyzed Organizational Areas

Refresh

Strong Adequate Stressed Critical

HOW TO READ THIS CHART

Each tile represents an operational area analyzed by AI. Colours indicate stress level based on priority: teal = strong (low priority), indigo = adequate (medium), orange = stressed (high), purple = critical.

KEY IMPLICATIONS

- 2 areas at critical stress level — immediate attention required.
- Multiple high-priority areas detected — systemic capability pressure is building.

Strategic Priorities

- 1 Improve execution capabilities across operational levels
- 2 Enhance decision-making processes to reduce latency
- 3 Increase engagement metrics through collaborative practices
- 4 Develop leadership alignment and competency
- 5 Upgrade technology for better feedback and adaptation

Quick Wins (30-90 Days)

- ✓ Conduct a rapid assessment workshop to identify immediate improvement areas in execution.
- ✓ Launch a pilot program for standardizing decision-making processes in one department to reduce latency.
- ✓ Initiate a bi-weekly cross-functional meeting to improve collaboration and create immediate accountability.

Sample Report Leading to Draft RFP

 Operations critical CURRENT STATE The operational capability is critically low, reflecting issues in execution and decision-making processes that directly impact performance. KEY ISSUES • Poor execution capability leading to project delays • High decision latency at middle and operational levels • Low engagement metrics hindering operational effectiveness RECOMMENDATIONS → Implement a system for tracking project execution with defined KPIs and regular reporting to enhance accountability. → Reduce decision latency by establishing standard operating procedures (SOPs) for middle and operational management to facilitate quicker approvals. → Enhance team engagement through regular feedback loops and workshops aimed at improving dialogue and collaboration.	 Finance & ROI high CURRENT STATE Financial management shows signs of moderate risk due to transformation pressures and ROI exposure while maintaining high strategic initiative ROI. KEY ISSUES • Inadequate financial processes leading to inefficiencies • High exposure to transformation-related risks • Need for improved financial KPIs to assess initiative performance RECOMMENDATIONS → Review and streamline financial processes to enhance efficiency and reduce bottlenecks. → Establish clear financial KPIs linked to each strategic initiative to monitor performance. → Create a financial education program for middle management to improve financial decision-making capabilities.	 HR & Talent high CURRENT STATE HR processes indicate low engagement and learning velocity, impacting talent utilization and retention rates. KEY ISSUES • High staff turnover due to lack of engagement and learning opportunities • Insufficient training and development resources • Limited cross-functional collaboration affecting talent deployment RECOMMENDATIONS → Implement regular staff engagement surveys to identify and address key issues affecting morale and retention. → Launch a training initiative focusing on skills necessary for future projects and roles within the organization. → Increase support for inter-departmental projects to promote talent mobility and integrate diverse skill sets.	 Marketing & Customer medium CURRENT STATE The marketing function is not fully aligned with operational capabilities and shows signs of friction in execution and customer engagement. KEY ISSUES • Low collaboration across functional areas resulting in fragmented marketing strategies • Inconsistencies in customer engagement approaches • Need for clearer insight into customer needs and market trends RECOMMENDATIONS → Develop a unified marketing strategy that integrates insights from operations and customer feedback. → Enhance customer relationship management (CRM) tools to better capture customer insights and engagement metrics. → Host regular customer feedback sessions to align marketing efforts with customer expectations.
 Decision Making critical CURRENT STATE Decision-making capabilities are weak, particularly at lower management tiers, leading to delays and inefficiencies. KEY ISSUES • Slow decision-making impacting operational efficiency • Limited trust in decision processes at lower management levels • Engagement metrics indicate a lack of clarity and alignment RECOMMENDATIONS → Establish cross-functional decision-making teams to enhance trust and collaboration, especially in operational scenarios. → Clarify decision-making roles and responsibilities to reduce ambiguity and improve response times. → Encourage a culture of transparency around decision processes to improve engagement scores.	 Leadership high CURRENT STATE Leadership shows moderate alignment but struggles with execution and engagement metrics, reflecting a need for development. KEY ISSUES • Lack of engagement from middle management results in poor organizational cohesion • Moderate leadership humility impacting innovation • Inadequate visioning and strategic alignment among leadership levels RECOMMENDATIONS → Conduct leadership development programs focused on humility, vision, and stakeholder engagement. → Facilitate regular leadership retreats to enhance strategic visioning and alignment across teams. → Encourage leaders to champion cross-departmental projects to foster collaboration and alignment.	 Technology high CURRENT STATE Technological infrastructure is inadequate for supporting organizational adaptation, reflecting low cybernetic capacity and feedback mechanisms. KEY ISSUES • Outdated technology limiting feedback and adaptability • Inability to utilize data for informed decision-making • Low integration of technology across teams RECOMMENDATIONS → Invest in upgrading technological tools to enhance data collection and feedback mechanisms. → Implement data analytics training for operational roles to drive informed decision-making practices. → Encourage the adoption of collaborative technology platforms to improve integration across teams.	

Governance & Risk Overlay

Small visual icons appear throughout the dashboard, elevating the conversation from HR capability assessment to **Board-level strategic risk management**. These markers translate capability constraints into governance-relevant risk categories.

Governance Risk

Decision authority ambiguity or accountability gaps threatening oversight effectiveness

Transformation Risk

Structural constraints likely to undermine change initiative ROI or strategic programme delivery

Latency Risk

Decision bottlenecks creating competitive disadvantage through delayed market response

ROI Exposure

Capability gaps directly threatening financial value in specific strategic pools

This risk overlay shifts the entire capability conversation from HR development to Board-level strategic risk and value protection, positioning LSC as governance intelligence rather than people analytics.

Integrated Dashboard Flow

The seven core instruments combine into a modular dashboard structure, mirroring competitor report polish whilst delivering system-level insight. Each instrument serves a specific diagnostic function whilst contributing to coherent organisational intelligence.

01

Organisational Capability Radar

System architecture health
across CTA stack

02

Direction Alignment Commitment Quadrant

Structural positioning and Tier
gating

03

Alignment Degradation Curve

Strategic coherence across layers

04

Capability Stress Map

Constraint zone identification

05

Engagement Integrity Dial

Systemic engagement health

06

Value Pool Exposure Map

ROI risk quantification

07

Tier Gating Position

Intervention readiness assessment

Architecture Summary

LSC Organisational Dashboard System

Seven integrated instruments providing comprehensive organisational intelligence, from system architecture health through to financial risk exposure. This dashboard transforms capability assessment into strategic governance intelligence.

1	Capability Radar System health across full CTA stack
2	DAC Quadrant Position Structural readiness and Tier gating
3	Alignment Degradation Curve Strategic coherence measurement
4	Capability Stress Map Constraint zone identification
5	Engagement Integrity Dial Systemic engagement health score
6	Value Pool Exposure Map ROI risk and financial exposure
7	Tier Gating Position Intervention viability assessment

Together, these instruments provide executives with organisational system intelligence — revealing not what skills people lack, but why organisations cannot convert capability into strategic outcomes. This is the architectural foundation for Board-level capability governance
